LAB REPORT on

Artificial Intelligence (23CS5PCAIN)

Submitted by

ANANYA N GOWDA (1BM23CS034)

in partial fulfillment for the award of the degree of
BACHELOR OF ENGINEERING
in
COMPUTER SCIENCE AND ENGINEERING

B.M.S. COLLEGE OF ENGINEERING

(Autonomous Institution under VTU)

BENGALURU-560019

Aug 2025 to Dec 2025

B.M.S. College of Engineering,
Bull Temple Road, Bangalore 560019
(Affiliated To Visvesvaraya Technological University, Belgaum)
Department of Computer Science and Engineering

CERTIFICATE

This is to certify that the Lab work entitled “Artificial Intelligence (23CS5PCAIN)” carried out by **ANANYA N GOWDA (1BM23CS034)**, who is a bonafide student of **B.M.S. College of Engineering**. It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Lab report has been approved as it satisfies the academic requirements in respect of an Artificial Intelligence (23CS5PCAIN) work prescribed for the said degree.

Dr. K R Mamatha Assistant Professor Department of CSE, BMSCE	Dr. Kavitha Sooda Professor & HOD Department of CSE, BMSCE

Implement Tic - Tac - Toe Game

Algorithm:

The image shows a handwritten algorithm for a Tic-Tac-Toe game, divided into two pages. The left page outlines the minimax algorithm and scoring system, while the right page shows the output of the game for several positions.

*** TIC TAC TOE**

mini max algorithm

- Mini: opponent trying to minimise your score (computer)
- Max: you trying to maximise your score.

Scoring system:

- +1 if comp wins
- -1 if you win
- 0 if its a tie.

maximise player

best score = $-\infty$

for each empty spot, make the best move

update score if min possibilities is there

return best score

minimise score

best score = $+\infty$

make move for empty spot

update score if min possibilities

return best score

if game is won

return +1 if comp wins

-1 if we win

if game tied,

return 0.

output:

enter pos (0-8) : 4

X		
	O	

enter pos (0-8) : 8

X		
	O	X
		O

enter pos (0-8) : 1

X	O	
		X
	X	O

enter pos (0-8) : 2

X	O	O
		X
	X	O

enter pos (0-9) : 6

X	O	O
	O	X
O	X	O

It's a draw.

Implement vacuum cleaner agent

Algorithm:

LAB - 1

Date: 20/8/25
Page: _____

* Robot vacuum cleaner algorithm

- 2 dimensional array $n \times m$
initial pos (0,0)
- visited array: to store coordinates of every cell it has cleaned
- recursive dfs()
 - if the current cell is visited, mark it clean()
 - explore all 4 directions (up, down, left, right)
- After the recursive dfs() ends, we need to get the robot back to initial position.
Fix the changedirection() to right or left only, to ensure uniformity.

* ~~TAG~~ ~~FOE~~

* Output:

Robot starts at room 0
move to 1 and clean
move to 2 and clean
move to 3 and clean
move to 0 and clean
~~stay at 0 and finish cleaning~~

Code:

```
def vacuum_cleaner()
    A = int(input("Enter state of A (0 for clean, 1 for dirty): "))
    B = int(input("Enter state of B (0 for clean, 1 for dirty): "))
    location = input("Enter location (A or B): ").upper()

    cost = 0
    state = {'A': A, 'B': B}

    if location == 'A':
        if state['A'] == 1: # If A is dirty
            print("Cleaned A.")

Program2

Implement Iterative deepening search algorithm

Algorithm:

LAB-2

Date 3/9/25
Page 3

8 - puzzle using misplaced tiles and Manhattan distance and IDDFS.

Perform iterative deepening search (IDDFS)

```

graph TD
    A((A)) --> B((B))
    A --> C((C))
    B --> D((D))
    B --> E((E))
    C --> F((F))
    C --> G((G))
    D --> H((H))
    D --> I((I))
    E --> J((J))
    F --> K((K))
    K --> Goal[goal state]
    
```

Depth	IDDFS
0	A
1	ABC
2	ABDECFG
3	ABDHIEJCFK

Solⁿ

Algorithm:

- Start with depth limit of 0.
- Perform DFS upto current depth limit
- if goal is found, end result
- else increment depth limit by 1
- Recursively continue DFS for that depth limit till the destination node is reached.

8 - puzzle problem

Overview: The 8 puzzle problem has a 3x3 grid with numbering 1-8 and a blank space. The end goal is to solve the jumbled arrangement and find/get the end result.

Possible moves: up, down, left, right

example

```

graph TD
    Root["8 6 7  
2 3 1"] --> L["8 6 7  
5 7  
2 3 1"]
    Root --> M["8 6 7  
5 4 4  
2 3 1"]
    Root --> R["8 6 7  
5 4 7

Program4

Implement Hill Climbing search algorithm to solve N-Queens problem

Algorithm:

LAB-4

Date: 8/10/25

Page: 1

* N-Queens using hill climbing Algorithm.

↓

Start with an arbitrary solution then iteratively improve it till no further improvements can be made

⇒ Algorithm

1. Start with a random solution state by placing n queens on the board.

2. Evaluation function - count no. of pairs of queens that are in conflict. lower the cost, better the solution. $f(n)$

for each pair of queens check

- if they are on same row
- or same diagonal

3. Move to neighbouring states

each iteration move to neighbouring state.

- for each column, try placing the queen in every possible row and evaluate the new configuration.

4. Choose the neighbouring state with lowest evaluation function.

If no better neighbouring states, stop algorithm. Then terminate.

eg:

$f(n)$ / conflicting pairs count = 6

$f(n) = 5$ $f(n) = 4$ $f(n) = 4$

$f(n) = 1$ $f(n) = 2$ $f(n) = 1$

$f(n) = 0$ $f(n) = 2$ $f(n) = 1$

✓

Hill climb Algorithm

- 1) Start with initial random state.
- 2) use heuristic $h(\text{state})$ to evaluate current state. (lower is better)
- 3) generate neighbouring states
- 4) select the best neighbouring possibilities
- 5) if the best neighbour is better, move to it else, stop
- 6) if not solved, restart with another random

Simulated Annealing

- 1) Initial random state.
- 2) initialise temperature
- 3) repeat till $T < \text{threshold}$:
 - generate random neighbour of current state
 - calc cost ΔE
 - $\Delta E = E_{\text{new}} - E_{\text{curr}}$
 - if $\Delta E < 0$ move to neighbour
 - else move to neighbour with probability $p = e^{-\Delta E/T}$
- 4) Decrease temp
- $T = \alpha \times T$
- 5) Return best sol

Code:

```
def calculate_cost(state):
    cost = 0
    n = len(state)
    for i in range(n):
        for j in range(i + 1, n):
            if state[i] == state[j] or abs(state[i] - state[j]) == abs(i - j):
                cost += 1
    return cost
```

```
def generate_neighbors(state):
    neighbors = []
    n = len(state)
    for col in range(n):
        for row in range(n):
            if state[col] != row: # move queen
                new_state = list(state)
                new_state[col] = row
                neighbors.append(new_state)
    return neighbors
```

```
def hill_climbing(initial_state):

Program 6

Create a knowledge base using propositional logic and show that the given query entails the knowledge base or not.

Algorithm:

Lab-6

Q) Create a knowledge base using propositional logic and show that the given query entails the knowledge base or not.

example:

study
If I understand a concept, I pass the exam
 $P \rightarrow Q$

If I pass the exam, I graduate
 $Q \rightarrow R$

Did I study?
Did I graduate? (x)

P: study
Q: pass
R: graduate

Query (x): R

* Knowledge Base (KB)
 $P \rightarrow Q$
 $Q \rightarrow R$
P
Query (x): R

Check: $KB \models \alpha$

Q) Does KB entail $R \rightarrow P$?

o/p

R	P	$R \rightarrow P$
T	T	T
T	F	F
F	T	T
F	F	T

→ here $R \rightarrow P$ is false but KB is true
∴ KB does not entail $R \rightarrow P$

Q) Does KB entail $Q \rightarrow R$?

o/p

Q	R	$Q \rightarrow R$
T	T	T
T	F	F
F	T	T
F	F	T

→ $Q \rightarrow R$ is false in all models where KB is true
∴ $KB \models (Q \rightarrow R)$

proceed

Done

shows

Truth Table Enumeration:							
P	Q	R	$P \rightarrow Q$	$Q \rightarrow R$	$(P \rightarrow Q) \wedge (Q \rightarrow R)$	Entails R?	
T	T	T	T	T	T	True	
T	T	F	T	F	F	False	
T	F	T	F	T	F	False	
T	F	F	T	T	F	False	
F	T	T	T	T	F	False	
F	T	F	T	F	F	False	
F	F	T	T	T	F	False	
F	F	F	T	T	F	False	
$\therefore KB \models R$

T | F | T | 0 | True
T | T | F | 1 | True
T | T | T | 1 | True

Result:
KB entails Query (True in all cases).

```

Program 7

Implement unification in first order logic

Algorithm:

Date 29/10/25

Lab-7
Unification in FOL

i) $P(f(x), g(y), y)$
 $P(f(g(z)), g(f(a)), f(a))$
 find θ (MGU)

ii) $Q(x, f(x))$
 $Q(f(y), y)$

iii) $H(x, g(x))$
 $H(g(y), g(g(z)))$

i) $x = g(z), y = f(x)$ // possible

ii) $x = f(y), y = f(x)$ // not possible

iii) $x = g(y)$ // possible
 $x = g(z)$
 $\Rightarrow y = z$

i) compare $f(x)$ and $f(g(z))$
 $\theta_1 = \{x/g(z)\}$
 $\rightarrow g(y) \neq g(f(a))$
 $\theta_2 = \{y/f(a)\}$
 $\rightarrow u \neq f(a)$
 $\theta_3 = \{u/f(a)\}$
 $\Rightarrow \theta = \{x/g(z), y/f(a), u/f(a)\}$
 Apply θ to both predicates
 $P(f(x), g(y), u)\{\theta\} =$
 $P(f(g(z)), g(f(a)/f(a))$
 $= P(f(g(z)), f(a), f(a))\{\theta\}$
 Both are identical

Date / /
Page

2. Comparing x and $f(y)$
 $x = f(y)$
 $f(x) \neq y$
 $f(x) = y$
 Now $x: f(f(y)) = y$
 \hookrightarrow cyclic not justifiable

3. Comparing x and $g(y)$
 $x = g(y)$
 comparing $g(x)$ and $g(g(z))$
 $x = g(y)$
 $g(x) = g(g(y))$
 can be unified
 when $y = z$
 $x = g(y)$
 $y = z$
 $z = g(z)$
 $y = z$

Thus MGU is
 $\theta = \{x/g(z), y/z\}$
 Substitute
 $H(x, g(x))\{x/g(z), y/z\} = H(g(z), g(g(z)))$
 $H(g(y), g(g(z))\{y/z\} = H(g(z), g(g(z)))$
 Thus successful unification

```

Program 8

Create a knowledge base consisting of first order logic statements and prove the given query using forward reasoning.

Algorithm:

Code:

```
facts = {  
    'American(Robert)': True,  
    'Hostile(A)': True,  
    'Sells_Weapons(Robert, A)': True  
}
```

If American(X) and Hostile(Y) and Sells_Weapons(X, Y), then Crime(X)
def forward_reasoning(facts):

If American(X) and Hostile(Y) and Sells_Weapons(X, Y), then Crime(X)

```
    if facts.get('American(Robert)', False) and facts.get('Hostile(A)', False) and facts.get('Sells_Weapons(Robert,
A)', False):
        facts['Crime(Robert)'] = True
```

```
forward_reasoning(facts)
```

```
if facts.get('Crime(Robert)', False):
    print("Robert is a criminal.")
else:
    print("Robert is not a criminal.")
```

Output:

Robert is a criminal.

Program 9

Create a knowledge base consisting of first order logic statements and prove the given query using forward reasoning.

Algorithm:

lab-9
FOL to CNF

*** Algorithm**

1. Eliminate conditionals and implications
eliminate \leftrightarrow replace $\alpha \leftrightarrow \beta$ with $(\alpha \rightarrow \beta) \wedge (\beta \rightarrow \alpha)$
eliminate \Rightarrow with $\neg \alpha \vee \beta$
2. Move \neg inwards
 $\neg(\forall x P) \equiv \exists x \neg P$
 $\neg(\exists x P) \equiv \forall x \neg P$
 $\neg(\alpha \vee \beta) \equiv \neg \alpha \wedge \neg \beta$
 $\neg(\alpha \wedge \beta) \equiv \neg \alpha \vee \neg \beta$
 $\neg \neg \alpha \equiv \alpha$
3. Standardise variables apart by renaming them
4. Skolemize
eg: $\exists x \text{ Rich}(x) \text{ becomes Rich}(G_1)$
 $G_1 \rightarrow \text{skolem constant}$
5. Drop universal quantifiers
 $\forall x \text{ Person}(x) \text{ becomes Person}(x)$
6. Distribute \wedge over \vee
 $(\alpha \wedge \beta) \vee \gamma \equiv (\alpha \vee \gamma) \wedge (\beta \vee \gamma)$

o/p:
example:
 $\forall x (P(x) \rightarrow \exists y Q(y, x))$
formula = f
'op': FORALL, 'var': 'x',
'body': f
'op': IMPLIES,
'left': f, 'op': ATOM, 'pred': 'P', 'args': [x]
'right': f
'op': EXISTS, 'var': 'y',
'body': f, 'op': ATOM, 'pred': 'Q', 'args': [y, x]
}
